

# Jade Investigation

Jade is a metamorphic rock consisting of the minerals jadeite or nephrite (although the jade in Mesoamerica only had jadeite, as nephrite is from China).

Jade was very precious to the ancient Maya people who used it to create items of jewellery and mosaic masks among other things.

**Your challenge is to investigate just how important jade was to the ancient Maya people and create a presentation to explain it back in class.**

**You may choose to create a poster, a quiz, write a speech, make a PowerPoint presentation or you can demonstrate your learning in any other way that you prefer.**
